4-(4-(IMIDAZOL-4-YL) PYRIMIDIN-2-YLAMINO) BENZAMIDES AS CDK INHIBITORS

The invention relates to pyrimidine derivatives, or pharmaceutically acceptable salts or *in vivo* hydrolysable esters thereof, which possess cell-cycle inhibitory activity and are accordingly useful for their anti-cell-proliferation (such as anti-cancer) activity and are therefore useful in methods of treatment of the human or animal body. The invention also relates to processes for the manufacture of said pyrimidine derivatives, to pharmaceutical compositions containing them and to their use in the manufacture of medicaments of use in the production of an anti-cell-proliferation effect in a warm-blooded animal such as man.

The cell cycle is fundamental to the survival, regulation and proliferation of cells and is highly regulated to ensure that each step progresses in a timely and orderly manner. The progression of cells through the cell cycle arises from the sequential activation and de-activation of several members of the cyclin-dependent kinase (CDK) family. The activation of CDKs is dependent on their interaction with a family of intracellular proteins called cyclins. Cyclins bind to CDKs and this association is essential for CDK activity (such as CDK1, CDK2, CDK4 and/or CDK6) within the cell. Different cyclins are expressed and degraded at different points in the cell cycle to ensure that activation and inactivation of CDKs occurs in the correct order for progression through the cell cycle.

Moreover, CDKs appear to be downstream of a number of oncogene signalling pathways. Deregulation of CDK activity by upregulation of cyclins and/or deletion of endogenous inhibitors appears to be an important axis between mitogenic signalling pathways and proliferation of tumour cells.

Accordingly it has been recognised that an inhibitor of cell cycle kinases, particularly inhibitors of CDK1, CDK2 and/or CDK4 (which operate at the G2/M, G1/S-S-G2/M and G1-S phases respectively) should be of value as an active inhibitor of cell proliferation, such as growth of mammalian cancer cells.

The inhibition of cell cycle kinases is expected to be of value in the treatment of disease states associated with aberrant cell cycles and cell proliferation such as cancers (solid tumours and leukemias), fibroproliferative and differentiative disorders, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, atherosclerosis, arterial restenosis, autoimmune diseases, acute and chronic inflammation, bone diseases and ocular diseases with retinal vessel proliferation.

WO 02/20512, WO 03/076435, WO 03/076436, WO 03/076434, WO 03/076433 and WO 04/101549 describe certain 2-anilino-4-imidazolylpyrimidine derivatives that inhibit the effect of cell cycle kinases. The present invention is based on the discovery that a novel group of 2-(4-amidoanilino)-4-(imidazolyl)pyrimidines inhibit the effects of cell cycle kinases, particularly CDK2, and thus possess anti-cell-proliferation properties. The compounds of the present invention are not specifically disclosed in any of the above applications and we have surprisingly found that these compounds possess beneficial properties in terms of one or more of their pharmacological activity (particularly as compounds which inhibit CDK2) and / or suitable for *in vivo* administration to a warm blooded animal, such as man. In particular these compounds have very high levels of cell and enzyme potency and high levels of exposure *in vivo*.

Accordingly, the present invention provides a compound of formula (I):

In this specification the term "alkyl" includes both straight and branched chain alkyl

groups but references to individual alkyl groups such as "propyl" are specific for the straight chain version only. For example, "C<sub>1</sub>-alkyl" and "C<sub>1</sub>-alkyl" include methyl, ethyl, propyl, isopropyl and *t*-butyl. However, references to individual alkyl groups such as "propyl" are specific for the straight chained version only and references to individual branched chain alkyl groups such as "isopropyl" are specific for the branched chain version only. A similar convention applies to other radicals.

It will be appreciated that certain of the various ring substituents in the compounds of the present invention may be introduced by standard aromatic substitution reactions or generated by conventional functional group modifications either prior to or immediately following the processes mentioned above, and as such are included in the process aspect of the invention. Such reactions and modifications include, for example, introduction of a substituent by means of an aromatic substitution reaction, reduction of substituents, alkylation of substituents and oxidation of substituents. The reagents and reaction conditions for such procedures are well known in the chemical art. Particular examples of aromatic substitution reactions include the introduction of a nitro group using concentrated nitric acid, the introduction of an acyl group using, for example, an acyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; the introduction of an alkyl group using an alkyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; and the introduction of a halogeno group. Particular examples of modifications include the reduction of a nitro group to an amino group by for example, catalytic hydrogenation with a nickel catalyst or treatment with iron in the presence of hydrochloric acid with heating; oxidation of alkylthio to alkylsulphinyl or alkylsulphonyl.

It will also be appreciated that in some of the reactions mentioned herein it may be necessary/desirable to protect any sensitive groups in the compounds. The instances where protection is necessary or desirable and suitable methods for protection are known to those skilled in the art. Conventional protecting groups may be used in accordance with standard practice (for illustration see T. W. Green, *Protective Groups in Organic Synthesis*, John Wiley and Sons, 1991). Thus, if reactants include groups such as amino, carboxy or hydroxy it may be desirable to protect the group in some of the reactions mentioned herein.

A suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxy carbonyl group, for example a methoxycarbonyl, ethoxycarbonyl or *t*-butoxycarbonyl group, an arylmethoxycarbonyl group, for example benzoyloxycarbonyl, or an aryl group, for example benzoyl. The deprotection conditions for the above protecting groups necessarily vary with the choice of protecting

group. Thus, for example, an acyl group such as an alkanoyl or alkoxycarbonyl group or an aroyl group may be removed for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such as a *t*-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulphuric or phosphoric acid or trifluoroacetic acid and an

arylmethoxycarbonyl group such as a benzyloxycarbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon, or by treatment with a Lewis acid for example boron tris(trifluoroacetate). A suitable alternative protecting group for a primary amino group is, for example, a phthaloyl group which may be removed by

treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine. A suitable protecting group for a hydroxy group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an aroyl group, for example benzoyl, or an arylmethyl group, for example benzyl. The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl

group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis with a base such as sodium hydroxide, or for example a *t*-butyl group which may be removed, for example, by treatment with an acid, for example an organic acid such as trifluoroacetic acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

The protecting groups may be removed at any convenient stage in the synthesis using conventional techniques well known in the chemical art.

As stated hereinbefore the compounds defined in the present invention possesses

anti-cell-proliferation activity such as anti-cancer activity which is believed to arise from the CDK inhibitory activity of the compound. These properties may be assessed, for example,

using the procedure set out below:-

#### Assay

The following abbreviations have been used :-

HEPES is *N*-[2-Hydroxyethyl]piperazine-*N'*-[2-ethanesulfonic acid]

DTT is Dithiothreitol

PMSF is Phenylmethylsulphonyl fluoride

The compounds were tested in an *in vitro* kinase assay in 96 well format using

Scintillation Proximity Assay (SPA - obtained from Amersham) for measuring incorporation of [ $\gamma$ -33-P]-Adenosine Triphosphate into a test substrate (GST-Retinoblastoma protein; GST-Rb). In each well was placed the compound to be tested (diluted in DMSO and water to correct concentrations) and in control wells either roscovitine as an inhibitor control or DMSO as a positive control.

Approximately 0.2  $\mu$ l of CDK2/Cyclin E partially-purified enzyme (amount dependent on enzyme activity) diluted in 25  $\mu$ l incubation buffer was added to each well then 20  $\mu$ l of GST-Rb/ATP/ATP33 mixture (containing 0.5  $\mu$ g GST-Rb and 0.2  $\mu$ M ATP and 0.14  $\mu$ Ci [ $\gamma$ -33-P]-Adenosine Triphosphate in incubation buffer), and the resulting mixture shaken gently, then incubated at room temperature for 60 minutes.

To each well was then added 150  $\mu$ l stop solution containing (0.8 mg/well of Protein A-PVT SPA bead (Amersham)), 20 pM/well of Anti-Glutathione Transferase, Rabbit IgG (obtained from Molecular Probes), 61 mM EDTA and 50 mM HEPES pH 7.5 containing 0.05% sodium azide.

The plates were sealed with Topseal-S plate sealers, left for two hours then spun at 2500 rpm, 1124 xg, for 5 minutes. The plates were read on a Topcount for 30 seconds per well.

The incubation buffer used to dilute the enzyme and substrate mixes contained 50 mM HEPES pH 7.5, 10 mM  $MnCl_2$ , 1 mM DTT, 100  $\mu$ M Sodium vanadate, 100  $\mu$ M NaF, 10 mM Sodium Glycero-phosphate, BSA (1 mg/ml final).

Test substrate

In this assay only part of the retinoblastoma protein (Science 1987

Mar13;235(4794):1394-1399; Lee W.H., Bookstein R., Hong F., Young L.J., Shew J.Y., Lee E.Y.) was used, fused to a GST tag. PCR of retinoblastoma gene encoding amino acids 379-928 (obtained from retinoblastoma plasmid ATCC pLRbRNL) was performed, and the sequence cloned into pGEx 2T fusion vector (Smith D.B. and Johnson, K.S. Gene 67, 31 (1988); which contained a tac promoter for inducible expression, internal lac I<sup>q</sup> gene for use in any E.Coli host, and a coding region for thrombin cleavage - obtained from Pharmacia Biotech) which was used to amplify amino acids 792-928. This sequence was again cloned into pGEx 2T.

The retinoblastoma 792-928 sequence so obtained was expressed in E.Coli (BL21 (DE3) pLysS cells) using standard inducible expression techniques, and purified as follows. E.coli paste was resuspended in 10ml/g of NETN buffer (50mM Tris pH 7.5, 120mM NaCl, 1mM EDTA, 0.5%v/v NP-40, 1mM PMSE, 1ug/ml leupeptin, 1ug/ml aprotinin and 1ug/ml pepstatin) and sonicated for 2 x 45 seconds per 100ml homogenate. After centrifugation, the supernatant was loaded onto a 10ml glutathione Sepharose column (Pharmacia Biotech, Herts, UK), and washed with NETN buffer. After washing with kinase buffer (50mM HEPES pH 7.5, 10mM MgCl<sub>2</sub>, 1mM DTT, 1mM PMSE, 1ug/ml leupeptin, 1ug/ml aprotinin and 1ug/ml pepstatin) the protein was eluted with 50mM reduced glutathione in kinase buffer. Fractions containing GST-Rb(792-927) were pooled and dialysed overnight against kinase buffer. The final product was analysed by Sodium Dodecyl Sulfate (SDS) PAGE (Polyacrylamide gel) using 8-16% Tris-Glycine gels (Novex, San Diego, USA).

CDK2 and Cyclin E

The open reading frames of CDK2 and Cyclin E were isolated by reverse transcriptase-PCR using HeLa cell and activated T cell mRNA as a template and cloned into the insect expression vector pVL1393 (obtained from Invitrogen 1995 catalogue number: V1392-20). CDK2 and cyclin E were then dually expressed [using a standard virus Baculogold co-infection technique] in the insect SF21 cell system (Spodoptera Frugiperda cells derived from ovarian tissue of the Fall Army Worm - commercially available).

Example production of Cyclin E/CDK2

The following Example provides details of the production of Cyclin E/CDK2 in SF21 cells (in TC100 + 10% FBS(TCS) + 0.2% Pluronic) having dual infection MOI 3 for each virus of Cyclin E & CDK2.

SF21 cells grown in a roller bottle culture to  $2.33 \times 10^6$  cells/ml were used to inoculate 10 x 500 ml roller bottles at  $0.2 \times 10^6$  cells/ml. The roller bottles were incubated on a roller rig at 28°C.

After 3 days (72 hrs.) the cells were counted, and the average from 2 bottles found to be  $1.86 \times 10^6$  cells/ml (99% viable). The cultures were then infected with the dual viruses at an MOI 3 for each virus.

The viruses were mixed together before addition to the cultures, and the cultures returned to the roller rig 28°C.

After 2 days (48 hrs.) post infection the 5 litres of culture was harvested. The total

cell count at harvest was  $1.58 \times 10^6$  cells/ml (99% viable). The cells were spun out at

2500rpm, 30 mins., 4°C in Heraeus Omnituge 2.0 RS in 250 ml. lots. The supernatant was

discarded.

#### 5 Partial co-purification of Cdk2 and Cyclin E

SF21 cells were resuspended in lysis buffer (50mM Tris pH 8.2, 10mM  $MgCl_2$ , 1mM

DTT, 10mM glycerophosphate, 0.1mM sodium orthovanadate, 0.1mM NaF, 1mM PMSE,

1µg/ml leupeptin and 1µg/ml aprotinin) and homogenised for 2 minutes in a 10ml Dounce

homogeniser. After centrifugation, the supernatant was loaded onto a Poros HQ/M 1.4/100

10 anion exchange column (PE Biosystems, Hertford, UK). Cdk2 and Cyclin E were coeluted at

the beginning of a 0-1M NaCl gradient (run in lysis buffer minus protease inhibitors) over 20

column volumes. Co-elution was checked by western blot using both anti-Cdk2 and anti-

Cyclin E antibodies (Santa Cruz Biotechnology, California, US).

By analogy, assays designed to assess inhibition of CDK1 and CDK4 may be

15 constructed. CDK2 (EMBL Accession No. X62071) may be used together with Cyclin A or

Cyclin E (see EMBL Accession No. M73812), and further details for such assays are

contained in PCT International Publication No. WO99/21845, the relevant Biochemical &

Biological Evaluation sections of which are hereby incorporated by reference.

Although the pharmacological properties of the compounds of the formula (I) vary

20 with structural change, in general activity possessed by compounds of the formula (I) may be

demonstrated at  $IC_{50}$  concentrations or doses in the range 250µM to 1nM.

When tested in the above in-vitro assay the CDK2 inhibitory activity of Example 28

was measured as  $IC_{50} = 0.003\mu M$ .

The *in vivo* activity of the compounds of the present invention may be assessed by

25 standard techniques, for example by measuring inhibition of cell growth and assessing

cytotoxicity.

Inhibition of cell growth may be measured by staining cells with Sulforhodamine B

(SRB), a fluorescent dye that stains proteins and therefore gives an estimation of amount of

protein (i.e. cells) in a well (see Boyd, M.R. (1989) Status of the NCI preclinical antitumour

30 drug discovery screen. Prin. Prac Oncol 10:1-12). Thus, the following details are provided of

measuring inhibition of cell growth:-

Cells may be plated in appropriate medium in a volume of 100ml in 96 well plates; the

media can be Dulbecco's Modified Eagle media for MCF-7, SK-UT-1B and SK-UT-1. The

- cells can be allowed to attach overnight, then inhibitor compounds may be added at various concentrations in a maximum concentration of 1% DMSO (v/v). A control plate may be assayed to give a value for cells before dosing. Cells may be incubated at 37°C, (5% CO<sub>2</sub>) for three days.
- 5 At the end of three days TCA may be added to the plates to a final concentration of 16% (v/v). Plates may be incubated at 4°C for 1 hour, the supernatant removed and the plates washed in tap water. After drying, 100ml SRB dye (0.4% SRB in 1% acetic acid) may be added for 30 minutes at 37°C. Excess SRB may be removed and the plates washed in 1% acetic acid. The SRB bound to protein may be solubilised in 10mM Tris pH7.5 and shaken for 30 minutes at room temperature. The ODs may be read at 540nm, and the concentration of inhibitor causing 50% inhibition of growth determined from a semi-log plot of inhibitor concentration versus absorbance. The concentration of compound that reduced the optical density to below that obtained when the cells were plated at the start of the experiment will give the value for toxicity.
- 15 Typical IC<sub>50</sub> values for compounds of the invention when tested in the SRB assay would be in the range 1nM to 1nM.
- The level of oral exposure of a compound can be measured by the following assay.
- This assay gives a semi-quantitative measure of the concentration of the compound achieved in the blood at a number of time points. Data available include C<sub>max</sub> (highest concentration achieved), and the AUC (area under the plasma concentration/time curve) for the compound. This gives a high throughput measure of likelihood of obtaining blood levels for each compound following oral dosing and as the data are normalised for dose, it allows direct comparison of each compound.
- 25 **High Throughput Blood Level Assay - Rat**
- A cocktail of 6 compounds is formulated in propylene glycol using a combination of vortex mixing, sonication and high speed shear mixing. This formulation consists of 5 test compounds (1 mg/ml) and a standard (0.5 mg/ml). The resulting formulation is a solution or a stable (≥ several hours) suspension.
- The formulation is dosed (2ml/kg) to two male rats (170-250 gm) which have been fasted for ≤16 hours then pre-dosed with water (~10 ml/kg). The dose for the test compounds is 2 mg/kg and for the standard it is 1 mg/kg.
- Serial blood samples are taken from rats at 0.5, 1, 2 and 4 hours post dose via the tail vein and a terminal sample is taken at 6-hour post dose.
- 30

The blood samples are centrifuged and plasma removed for analysis. The two plasma samples for a given time point are combined prior to analysis.

A single set of 6 calibration standards containing all 6 compounds covering the concentration range (0.3 ng/ml to 3 µg/ml) are prepared by spiking blank plasma. The samples and standards are extracted by precipitation with 2 volumes of acetonitrile followed by centrifugation. The resulting supernatant is then diluted with water (10 fold). Samples are analysed by LC/MS-MS and the concentration obtained is used to determine the C<sub>max</sub> µg/ml (maximum compound level detected), AUC<sub>0-6hr</sub> µg/hr/ml (area under the curve) and t<sub>max</sub> hr (time that the maximum compound levels have been measured) for a given compound to give an indication of exposure

**High Throughput Blood Level Assay - Mice**

The above assay may be run using mice in place of rats, but with the following variations.

For a profile in mice 10 male mice are dosed at the same level as to rats but they are not fasted or predosed with water. Furthermore, samples from mice are all terminal, with 2 mice per time point.

When tested in the above assay Example 25, in the AP rat (see below), normalised to a 1 mg/kg dose, C<sub>max</sub> was 0.3995 µM, and AUC was 0.8295 µM.h. In the AP mouse (see below), again normalised to 1 mg/kg, C<sub>max</sub> = 0.68 µM, and AUC was 1.50 µM.h.

Note the rats used in the above experiment were Alderley Park (AP) rats. The AP rat is a Wistar derived animal imported into ICI from the Wistar unit via Porton Down in the 1940's. The stock was rederived by fostering onto Sprague Dawleys and has remained a closed colony since 1959. The nomenclature for these animals is Alpk..APFSD.

The mice used in the above experiment were AP mice. The AP mouse was originally obtained from a commercial breeder Schoeffelds in 1956. The stock was rederived by fostering onto a CD-1 Charles Rivers (commercial supplier) outbred mouse and has remained a closed colony ever since. The nomenclature for these animals is Alpk..APFCD-1.

According to a further aspect of the invention there is provided a pharmaceutical composition which comprises a pyrimidine derivative of the formula (I), or a pharmaceutically acceptable salt or *in vivo* hydrolysable ester thereof, as defined hereinbefore in association with a pharmaceutically-acceptable diluent or carrier.

The composition may be in a form suitable for oral administration, for example as a tablet or capsule, for parenteral injection (including intravenous, subcutaneous, intramuscular,

intravascular or infusion) as a sterile solution, suspension or emulsion, for topical administration as an ointment or cream or for rectal administration as a suppository. In general the above compositions may be prepared in a conventional manner using conventional excipients.

The compound of formula (I) will normally be administered to a warm-blooded animal at a unit dose within the range 5-5000 mg per square meter body area of the animal, i.e. approximately 0.1-100 mg/kg, and this normally provides a therapeutically-effective dose. A unit dose form such as a tablet or capsule will usually contain, for example 1-250 mg of active ingredient. Preferably a daily dose in the range of 1-50 mg/kg is employed. However the daily dose will necessarily be varied depending upon the host treated, the particular route of administration, and the severity of the illness being treated. Accordingly the optimum dosage may be determined by the practitioner who is treating any particular patient. According to a further aspect of the present invention there is provided a compound of the formula (I), or a pharmaceutically acceptable salt or *in vivo* hydrolysable ester thereof, as defined hereinbefore for use in a method of treatment of the human or animal body by therapy.

We have found that the compounds defined in the present invention, or a pharmaceutically acceptable salt or *in vivo* hydrolysable ester thereof, are effective cell cycle inhibitors (anti-cell proliferation agents), which property is believed to arise from their CDK inhibitory properties. Accordingly the compounds of the present invention are expected to be useful in the treatment of diseases or medical conditions mediated alone or in part by CDK enzymes, i.e. the compounds may be used to produce a CDK inhibitory effect in a warm-blooded animal in need of such treatment. Thus the compounds of the present invention provide a method for treating the proliferation of malignant cells characterised by inhibition of CDK enzymes, i.e. the compounds may be used to produce an anti-proliferative effect mediated alone or in part by the inhibition of CDKs. Such a compound of the invention is expected to possess a wide range of anti-cancer properties as CDKs have been implicated in many common human cancers such as leukaemia and breast, lung, colon, rectal, stomach, prostate, bladder, pancreas and ovarian cancer. Thus it is expected that a compound of the invention will possess anti-cancer activity against these cancers. It is in addition expected that a compound of the present invention will possess activity against a range of leukaemias, lymphoid malignancies and solid tumours such as carcinomas and sarcomas in tissues such as the liver, kidney, prostate and pancreas. In particular such compounds of the invention are

expected to slow advantageously the growth of primary and recurrent solid tumours of, for example, the colon, breast, prostate, lungs and skin. More particularly such compounds of the invention, or a pharmaceutically acceptable salt or *in vivo* hydrolysable ester thereof, are expected to inhibit the growth of those primary and recurrent solid tumours which are associated with CDKs, especially those tumours which are significantly dependent on CDKs for their growth and spread, including for example, certain tumours of the colon, breast, prostate, lung, vulva and skin.

It is further expected that a compound of the present invention will possess activity against other cell-proliferation diseases in a wide range of other disease states including leukaemias, fibroproliferative and differentiative disorders, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atherosclerosis, arterial restenosis, autoimmune diseases, acute and chronic inflammation, bone diseases and ocular diseases with retinal vessel proliferation.

Thus according to this aspect of the invention there is provided a compound of the formula (I), or a pharmaceutically acceptable salt or *in vivo* hydrolysable ester thereof, as defined hereinbefore for use as a medicament; and the use of a compound of the formula (I), or a pharmaceutically acceptable salt or *in vivo* hydrolysable ester thereof, as defined hereinbefore in the manufacture of a medicament for use in the production of a cell cycle inhibitory (anti-cell-proliferation) effect in a warm-blooded animal such as man. Particularly, an inhibitory effect is produced by preventing entry into, or progression through, the S phase by inhibition of CDK2 and CDK4, especially CDK2, and M phase by inhibition of CDK1.

Preventing cells from entering DNA synthesis by inhibition of essential S-phase initiating activities such as CDK2 initiation may also be useful in protecting normal cells of the body from toxicity of cycle-specific pharmaceutical agents. Inhibition of CDK2 or 4 will prevent progression into the cell cycle in normal cells which could limit the toxicity of cycle-specific pharmaceutical agents which act in S-phase, G2 or mitosis. Such protection may result in the prevention of hair loss normally associated with these agents.

HBTV (257 mg) was added to a stirred suspension of 4-[[4-(1-isopropyl-2-methyl-1H-imidazol-5-yl)pyrimidin-2-yl]amino]benzoic acid sodium salt (Method 56; 240 mg) in DMF (8 ml). The mixture was stirred at ambient temperature for 20 minutes, then 3-aminotetrahydrothiophene-S,S-dioxide hydrochloride (170 mg) and DIPEA (139  $\mu$ l) was added. The mixture was stirred at ambient temperature for 18 hours, then diluted with EtOAc (80 ml), washed with 2N NaOH (80 ml). The aqueous layer was extracted with further EtOAc (80 ml) and the organics were concentrated in vacuo. The residue was purified by RP-HPLC. Fractions containing product were poured onto a 10g SCX-2 column, washed with MeOH, then eluted with methanolic ammonia. Evaporation of the basic eluent gave the title compound as a white solid (150 mg, 49 %).
